Preface ................................................................................................................................. v
Acknowledgements .............................................................................................................. vii
Nomenclature ..................................................................................................................... ix
List of Tables ....................................................................................................................... xvii
1 Introduction ...................................................................................................................... 1
   1.1 Filtering and Parameter Estimation ............................................................................. 1
   1.2 Recursive Parameter Estimation for State-Space Models ........................................... 3
   1.3 Dissertation Outline ............................................................................................... 7
2 Mathematical Preliminaries ............................................................................................. 11
   2.1 Notation .................................................................................................................. 11
   2.2 Kronecker Products and Stacking Operations ......................................................... 12
   2.3 Matrix Differential Calculus ................................................................................... 13
   2.4 Gauss-Newton Algorithm for a Least-Squares Cost Functional .............................. 16
   2.5 Gauss-Newton Algorithm for a Maximum-Likelihood Cost Functional .................. 19
3 Approximate Nonlinear Filters ....................................................................................... 23
   3.1 General Filtering Algorithm ................................................................................... 24
   3.2 Rederivation of Higher-Order Terms ....................................................................... 26
4 Adaptive Filtering and Recursive Parameter Estimation ............................................... 31
   4.1 Introduction and Chapter Overview ......................................................................... 31
   4.2 State Augmentation ............................................................................................... 33
   4.3 Sensitivity-Based Approaches to Parameter Estimation ......................................... 36
   4.4 Adaptive Constant-Gain Filtering .......................................................................... 38
   4.5 Adaptive Extended Kalman Filtering ...................................................................... 42
   4.6 Adaptive Higher-Order Filters ............................................................................... 48
   4.7 Discussion of the Cost Functional and Related Approximations ............................. 53
   4.8 Relationship between State Augmentation and the Sensitivity Model ..................... 54
CONTENTS

4.9  Relationship to Other Approaches .................................................................59
4.10 Chapter Summary and Discussion .................................................................62

5 Implementation of the Propagation Equations .................................................65

6 Simulation Studies ...........................................................................................69

6.1 Adaptive Filtering for a Van der Pol Oscillator .............................................69
6.2 Parameter Estimation for a Van der Pol Oscillator (I) ......................................74
6.3 Parameter Estimation for a Van der Pol Oscillator (II) ...................................78
6.4 Parameter Estimation for a Van der Pol Oscillator (III) .................................81
6.5 Identification of a Wiener System .................................................................84
6.6 Parameter Estimation and Identification of an Input Nonlinearity (I) ...............88
6.7 Parameter Estimation and Identification of an Input Nonlinearity (II) .............93
6.8 Chapter Summary and Discussion .................................................................98

7 Real-Time Identification ...................................................................................101

7.1 Estimation of Constant Parameters ...............................................................102
7.2 Tracking Parameter Changes .......................................................................104

8 Conclusion .......................................................................................................109

Appendix A: Matrix Differential Calculus .........................................................119

Appendix B: Auxiliary Derivations for Chapter 3 ................................................123

B.1 Derivation of Equation (3.21) .......................................................................123
B.2 Derivation of Equation (3.25) .......................................................................124

Appendix C: Reformulation of the State-Augmented Extended Kalman Filter ....127

Appendix D: Description of the Three-Tank System ...........................................133

D.1 The Three-Tank System ...............................................................................133
D.2 Determining the Parameters .......................................................................135

References .........................................................................................................139
